

Safety Platform

A Plain-Language Guide to How the New System Works

FROM A SINGLE-APP PRODUCT TO A PLATFORM ANY ORGANIZATION CAN USE

PREPARED BY

Abhimanue T J – Magnet Systems

CONTENTS

What's in this document

This guide explains the new platform in plain language — no technical background needed. It walks through what's changing, who uses the system, and how everyday situations play out.

01 — EXECUTIVE SUMMARY

The Big Picture

The Safety app started as a simple way for one college to let students report safety issues — bullying, harassment, and emergencies — and let staff follow up. It works well, but it was built for exactly one organization.

This document explains our plan to turn it into something bigger: a safety platform that any organization — colleges, companies, care homes, even individual families — can use, each with their own private space, while we maintain just one product behind the scenes.

WHY THIS MATTERS

Right now, the system only understands “College” and “Student.” To sell this to new kinds of customers, it needs to understand any organization and any kind of member — without us rebuilding the app every time we sign up a new type of client.

What you'll find in this guide

- The plan in plain language — what changes, and why it makes the product more valuable
- Every type of user explained simply, with what they can and can't see
- Real examples showing the system in action, start to finish
- Diagrams and charts for user flows, who sees what, and how cases move
- How a brand-new organization gets set up, whatever industry they're in
- A feature idea (Departments) we'd like your input on before we build it
- A simple delivery timeline for what ships first

02 — TODAY VS. TOMORROW

Where We Started, Where We're Going

Where we started

Today's product is a working, reliable system built for one audience: college students. It has three parts —

- A member app, where people file reports, including anonymous and emergency ones
- A staff dashboard, where staff review and resolve those reports
- A shared backend that connects the two and keeps everything stored securely

HOW THE PRODUCT IS PUT TOGETHER TODAY

THE CORE LIMITATION

The system currently assumes every single user is a “student” at a “college.” There's no way today for a company, care home, or family to use it as-is — every screen and workflow speaks the language of one industry.

Where we're going

We're generalizing the industry-specific language into flexible equivalents that work for any organization — no rebuild required each time we add a new type of client.

TODAY'S TERM	NEW TERM	WHY IT CHANGES
College	Organization	Works for any institution or company, not only colleges
Student	Member	A general person profile, with fields that adapt to the industry
Complaint	Incident	Covers HR cases, safety issues, and emergencies alike
One admin role	Owner / Admin / Staff	Separates billing, oversight, and day-to-day casework
(didn't exist)	Guardian	A new, privacy-respecting family link, active only during emergencies
Manual location refresh	Smarter location sharing	Starts simple today, becomes live tracking as a later upgrade

03 — WHY YOU CAN TRUST THIS SYSTEM

Built So Every Organization Stays Private

This system will hold sensitive safety and HR information for many different organizations at once. Three deliberate decisions keep that information safe, private, and easy to manage.

One reliable system underneath

Rather than running two separate systems to get “flexibility,” we keep one dependable database for everything, with a small amount of built-in flexibility so each industry can capture the details it needs (like “grade level” for a college versus “department” for a company). One system means one thing to secure, one thing to back up, and far fewer places for something to go wrong.

Two independent locks on every organization's data

An organization's data must never be visible to any other organization — so we don't rely on a single safeguard. We enforce it twice: once in how the application itself is built, so a developer can't accidentally forget to scope a request to the right organization, and a second time at the database level itself, acting as a fail-safe that physically blocks any request — even a mistaken one — from crossing into another organization's data.

DEFENSE IN DEPTH

If the first safeguard is ever bypassed by human error, the second one still holds. That matters here — a data leak between organizations wouldn't just be a bug, it would be a trust failure.

A separate, closely watched support role

Our own team occasionally needs to help troubleshoot an organization's account. That level of access is treated as its own distinct, tightly controlled role — not a hidden shortcut inside the app. Every single time it's used, it's logged separately from ordinary activity, so there's always a clear, reviewable record of when and why our team looked at an organization's data.

04 — ROLES & PERMISSIONS

Who Uses the Platform

Six kinds of people use the platform. Each one has a simple, clear answer to one question: what should this person be able to see, and why?

Member

A student, employee, or resident — the everyday person the platform exists to protect. Sees only their own reports.

Guardian

A parent or family member linked to a Member. Sees nothing about routine reports — only alerted during a genuine emergency.

Staff / Responder

A teacher, HR rep, or security officer. Investigates and resolves only the cases assigned to them.

Admin

Runs safety operations for one organization. Sees everything inside their organization, nothing beyond it.

Owner

Accountable for the organization's account overall — billing, compliance, and who has access.

Support Team

The Magnet Systems team. Manages the platform itself; only steps into an organization's data as a rare, logged exception.

THE GOLDEN RULE

A Member sees only their own reports. A Guardian is alerted only during emergencies, never for routine matters. Staff only see cases assigned to them. An Admin sees everything in their own organization, but nothing beyond it. An Owner carries overall accountability. Our own Support Team can only cross into an organization's data as a rare, fully logged exception.

Who can see what

Green means yes. Grey means no. Amber means the Support team can only look when helping — and every look is logged.

	Member	Guardian	Staff	Admin	Owner	Support
Own reports	Yes	No	No	No	No	No
Other members' reports	No	No	No	Yes	Yes	Logged / rare
Assigned cases	No	No	Yes	Yes	Yes	Logged / rare
All org cases	No	No	No	Yes	Yes	Logged / rare
Emergency location	Yes	Yes	Yes	Yes	Yes	Logged / rare
Billing / access	No	No	No	No	Yes	No

05 — ROLES IN PRACTICE

How Everyday Roles Work Together

Owner, Admin, and Staff aren't three disconnected roles — they build on each other. Every higher role can also do everything the role below it can. Nobody is ever blocked from rolling up their sleeves and handling a case themselves.

Owner — everything below, plus billing, compliance, and adding or removing Admins

Admin — everything below, plus assigning cases, managing the team, and dashboards

Staff — investigates and responds to the cases assigned to them

Why we built it this way

- A one-person organization just signs up as Owner and can personally handle every case — no need to create separate accounts to get started.
- A growing organization invites Admins, who can also handle cases themselves in addition to managing the team.
- A larger organization adds Staff and starts assigning specific cases to specific people as the workload grows.
- Assigning a case is always optional — an Owner or Admin can simply pick up and resolve a case directly, any time.

THE PAYOFF

A small organization never has to set up unnecessary accounts just to get started. And when that organization grows, nothing needs to be rebuilt — they simply start inviting people into the roles beneath them.

06 — STEP BY STEP

A Day in the Life of Each Role

Here's what each person actually does inside the app, from their own point of view.

Member

- 1 Signs up and completes a profile (the questions adapt to the organization type)
- 2 Optionally joins an organization with a join code — or simply uses the app on their own
- 3 Can invite a Guardian with a one-time code, if they choose to
- 4 Files a report — normal, anonymous, or emergency
- 5 Tracks its progress: Submitted → Under Review → Investigating → Resolved
- 6 Gets notified the moment it's resolved

Guardian

- 1 Receives a one-time invite code from the Member they're connected to
- 2 Enters the code to establish the connection
- 3 Sees nothing about everyday reports — privacy is kept by default
- 4 Gets an instant alert with location the moment the Member triggers an emergency

Staff / Responder

- 1 Logs in and sees only the cases assigned to them
- 2 Reviews the details and any evidence provided
- 3 Messages the Member directly if follow-up questions come up
- 4 Investigates, documents findings, and closes the case

Admin & Owner

- 1 Sees every case, staff member, and member in their organization
- 2 Assigns incoming reports to the right person
- 3 Watches simple dashboards — how many cases, how fast they're resolved, and trends over time
- 4 Owners additionally manage billing, compliance, and who has Admin access

08 — VISUAL GUIDE

How a Case Moves

Every report follows the same four statuses. The Member can watch the case move — they never have to chase anyone for an update.

INCIDENT LIFECYCLE

Three ways a Member can file

The same person can file a named report, stay anonymous, or hit Emergency. The path after that is different on purpose.

WHO IS NOTIFIED, BY CASE TYPE

	Routine report	Anonymous report	Emergency SOS
Member (status updates)	Yes	Yes	Yes
Assigned Staff	Yes	Yes	Yes
Admin / Owner	Yes	Yes	Yes
Guardian	Not notified	Not notified	Alerted

READ THIS CHART IN ONE LINE

Guardians are never told about routine or anonymous reports. They are only alerted when the Member taps Emergency SOS.

09 — IN PRACTICE

Real-World Scenarios

A few examples showing exactly how the pieces come together, end to end.

A student reports bullying at their college

A student files a report, choosing to stay anonymous. It reaches the college's safety team, an Admin assigns it to a Staff member, and that Staff member investigates and messages the student if needed. Once resolved, the student is notified.

Nobody outside the college's safety team — not other students, not the family — ever sees this, unless it becomes an emergency.

A student is in immediate danger

The student taps the emergency button. Their location is captured instantly. The college's security team and the linked Guardian are alerted at the exact same moment — neither has to wait on the other. Security can respond on the ground while the family calls the student directly.

Someone with no organization at all

A person can sign up entirely on their own and invite a parent or guardian using a code. There's no reporting system for them — just a direct emergency button that alerts their guardian immediately. Simple, on purpose: just a person and the family who cares about them.

That same person later joins an organization

They receive a join code, enter it, and their account simply gains the organization's reporting features. Their guardian connection carries over unchanged — nothing is lost, nothing is rebuilt.

A care home onboards many residents at once

An Admin prepares a simple spreadsheet of residents and their guardians, and uploads it to create every connection at once. Guardians then experience the app exactly the same way as if they'd been invited individually.

10 — USER FLOWS

Visual User Flows

The same stories as the previous page, drawn as flows so you can see who acts when.

Emergency — two alerts at once

10 — USER FLOWS • CONTINUED

From standalone person to organization member

A person can use the app with only a Guardian. If they later join a college, company, or care home, the same account simply gains reporting — the family link is not rebuilt.

No organization required

Same account — nothing is rebuilt

Care home bulk onboarding

MANY PEOPLE, ONE UPLOAD

WHY THIS MATTERS

Staff should not have to invite hundreds of people one code at a time. The end experience for a Guardian is identical either way.

11 — GETTING STARTED

Getting a New Organization Started

Every new organization follows the same six simple steps — only the wording and the questions asked change, based on the type of organization.

- 1 The Owner signs up and chooses their industry
- 2 A short setup adapts automatically to that industry
- 3 Branding and settings — logo, categories, and which features are turned on
- 4 The Owner adds Admins, who in turn add Staff
- 5 Members join, either one at a time with a code or all at once via spreadsheet
- 6 Go live — the dashboard is active and reports can start coming in

How the setup adapts by industry

INDUSTRY	WHAT'S COLLECTED	WHAT'S TURNED ON
Education (College / School)	Courses, hostel details, academic year	Guardian alerts on, bullying/ragging categories
IT / Corporate	Department, office location, employee ID	Guardian alerts usually off, HR-style categories
Care Home / Orphanage	Facility details, residents, staff structure	Guardian alerts on, bulk sign-up enabled by default
Other / Custom	Whatever the Owner chooses to collect	Configured manually at setup

Because these extra details are stored flexibly rather than hard-coded, onboarding a brand-new type of organization in the future never requires rebuilding the platform.

12 — FEATURE SPOTLIGHT — PROPOSED

Departments: Making Large Organizations Easier to Manage

This is a proposed addition we'd like your sign-off on before it's built. It's aimed squarely at larger organizations — a big college with multiple faculties, or a company with HR, Engineering, and Sales — where every report currently lands in one shared pile for an Admin to sort by hand.

The idea, simply

An Organization could optionally set up Departments inside it — for example “HR,” “Engineering,” or “Hostel Affairs.” This is completely optional per organization; nothing changes for a small team unless they choose to turn it on.

1. Focused Staff access · 2. Automatic routing · 3. Department-level reporting

Why it won't complicate things for smaller organizations

- Departments are optional, per organization — a small team that never creates one continues to work exactly as it does today, with one shared queue.
- A larger organization turns it on, sets up its departments, and assigns Staff and Members to them, entirely at its own pace.
- Admins and Owners always see across every department, regardless — the focused-access restriction only applies to Staff, so oversight at the top is never lost.

OUR RECOMMENDATION

Give each Member one department — treated as a simple routing tag, not a rigid org chart. For the rare case of someone who genuinely spans two areas (for example a cross-functional safety committee), we'd rather let a Staff member be tied to multiple departments — which we already need for supervisors — instead of complicating what a Member's identity means. This keeps the everyday model simple while still solving the real need.

13 — DELIVERY PLAN

What's Being Built, and When

We're delivering this in five stages, so a complete, launch-ready product is available well before every feature is finished.

- 1 Foundation — the new Organization & Member model, and getting new organizations set up
- 2 Roles & privacy — Owner / Admin / Staff permissions, and keeping every organization's data separate
- 3 Guardian linking — the family connection and consent flow
- 4 Emergency alerts — instant location sharing the moment help is needed (launch-ready)
- 5 Live location tracking — a continuously updating map during an active emergency (fast-follow)

LAUNCH IS STAGE 4 · LIVE TRACKING FOLLOWS AFTER

RECOMMENDED APPROACH

Stages 1 through 4 form a complete, launchable product on their own. Stage 5 (continuous live tracking) is intentionally sequenced after launch, so it can be built and tested properly without holding up delivery of the core safety platform.
